## **Receptors in the Human Nervous System** Frederick Mendelsohn

Receptors in the Human Nervous System is a synthesis of the results of receptor mapping by leaders in the field. In addition to a comprehensive discussion of the distribution and possible interactions of the receptors of different neuroactive substances, this book also contains an abundance of pictorial representations of receptor distributions. High-quality photographs of one receptor are often juxtaposed with photographs of the distribution of a different receptor or receptor subtype for the consideration of possible interactions between different systems.

The book surveys the distribution of receptor subtypes for the classical monoamine transmitters (acetylcholine, adrenaline, noradrenaline and serotonin) as well as the distribution of receptors for the excitatory and inhibitory amino acids, (glutamate, GABA and benzodiazepines) as well as the opioid peptides, angiotensin and other neuropeptides. The distribution of multiple types of serotonin receptors is given in detail, and the codistribution of receptors in the cortex is discussed. The book is directed toward researchers in the field of chemical neuroanatomy, as well as pharmacologists, neurophysiologists, and neuroscientists.
